#### **DETAILED ACTION**

# Response to Arguments

Applicant's arguments filed 10/26/05 have been fully considered but they are not persuasive.

Applicant states (Page 6)

"However, the Office Action further states that Wilson in view of Mallik fails to teach an automated means for demetallizing the web in registration with a preprinted image"

Applicant takes the statement out of context, however concluding (Page 7)

"Although Hurley teaches the use of registration marks for downstream cutting and printing operations it has nothing to do with demetallizing a web in registration with a preprinted image..."

This is a piecemeal analysis of the rejection. The previous Office Action states that Mallik teaches demetallizing in registration with a preprinted image and that the deficiency is providing an *automated* process for registration using a registration mark and observation means.

One cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

# Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 1-12 are rejected under 35 U.S.C. 112, first paragraph, as containing subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

While the roller and film are in contact, they move together at the same speed, and the position of the roller surface relative to the web surface remains the same. According to the specification, the

Art Unit: 1763

registration marks are used to adjust the speed of the roller and film. It is not clear how the changing speed of the roller and film causes the demetalization location to change relative to the pre-printed image (i.e.; in register) since the location of the demetallization pattern is fixed relative to the pre-printed web.

Applicant's amendment does not clarify the issue, since it is clear that the web is pre-printed with an image prior to a second printing with an etchant. What is not clear is how the change in speed of the roll and web (which must move together) somehow affects the location of the second printing with etchant.

### Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent 4,959,120 to Wilson in view of U.S. Patent 5,128,779 to Mallik and in further view of U.S Patent 4,745288 to Hurley et al.

Wilson teaches a method for the selective demetallization of a web coated with a metal film.

Referring to figure 7, Wilson shows conveying the web material through a demetallization station including indexing means (reads on means to rotate a print roller) whereby predetermined portions of the metal film are removed or thinned to create or reveal visual elements of the web material.

Wilson does not show the use of a web having a preprinted image. Wilson only suggests that the process is useful for making security documents such as a credit card (Col. 7, Line 29-32). Mallik shows a web coated with a metallic foil for producing the same type of authenticating documents (Col 1, Lines 15-20). The web has printed information on the surface. See figure 1. It would have been obvious to one of ordinary skill in the art at the time of invention to use a preprinted web as shown by Mallik in the method of Wilson in order to produce a security document that contains suitable information, such as

Application/Control Number: 09/809,141

Art Unit: 1763

personal identification. Motivation to use the material of Maillik with the demetalization process of Wilson is likewise given in Mallik (Col. 6, Lines 21-32 and 54-59).

Wilson also does not show demetallizing the web in registration with a preprinted image. Mallik, however, does show the demetallization in registration with the preprinted image. See figure 2. It would have been obvious to one of ordinary skill in the art at the time invention to demetallize the web in registration with a preprinted image in order to create a feature that cannot be easily altered or duplicated. The visual information behind the hologram on a surface to which it is attached can then be viewed through the non-reflective areas of the hologram (Col. 2, Lines 44-46).

Wilson in view of Mallik does not expressly show an automated means for demetallizing the web in registration with a preprinted image. However, the film is clearly aligned either manually or using an automated means. Hurley teaches the use of a controller to sense the presence and location of registration marks on a web as the web passes a scanner (observation means). Then the controller sends a signal to modify downstream operations such as printing or in this case the alignment of the demetalization roll. See abstract. It would have been obvious to one of ordinary skill in the art at the time invention to use the controller registration marks and observation means of Hurley to automate the printing means of Wilson in view of Mallik in order to automate a manual activity. See *In re Venner* 120 USPQ 193, 194 (CCPA) 1958.

Regarding claims 2-6 and 11-12, the office takes notice that the several listed methods of image formation and web materials used are old and well known in the art of secure document production and that one of ordinary skill would be expected to know them.

Regarding claim 7, Mallik teaches the attachment of the demetalized web to another web having images thereon, using an adhesive between materials, and thereafter adhesively transferring, in registration, areas of images from the second web to the demetalized web by a cold foil stamping process (Col. 4, Line 63- Col. 5, Line 5). Note that both hot and cold stamping processes are old and well-known methods in the art of producing secure documents.

Regarding claims 8 and 10, Mallik shows demetallization revealing designs or patterns hidden in the original images on the web. Mallik also shows removal of metal from an area adjacent to but not

Application/Control Number: 09/809,141

Art Unit: 1763

covering originally placed images. See figures 2, 9 and 10. It would have been obvious to one of ordinary skill in the art at the time of invention to selectively remove the metal over and around the pre-placed images on the web in order to increase the difficulty of counterfeiting the structure.

Regarding claim 9, the use of moiré patterns in security documents such as currency is old and well known in the art as admitted by applicant in paragraph 35. It would have been obvious to one of ordinary skill in the art at the time invention to use a moiré pattern in order to produce a document that is extremely difficult to duplicate.

### Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Roberts Culbert whose telephone number is (571) 272-1433. The examiner can normally be reached on Monday-Friday (8:30-5:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Parviz Hassanzadeh can be reached on (571) 272-1435. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
